

# Lunar History

Dr. Jennifer Edmunson  
March 17, 2009

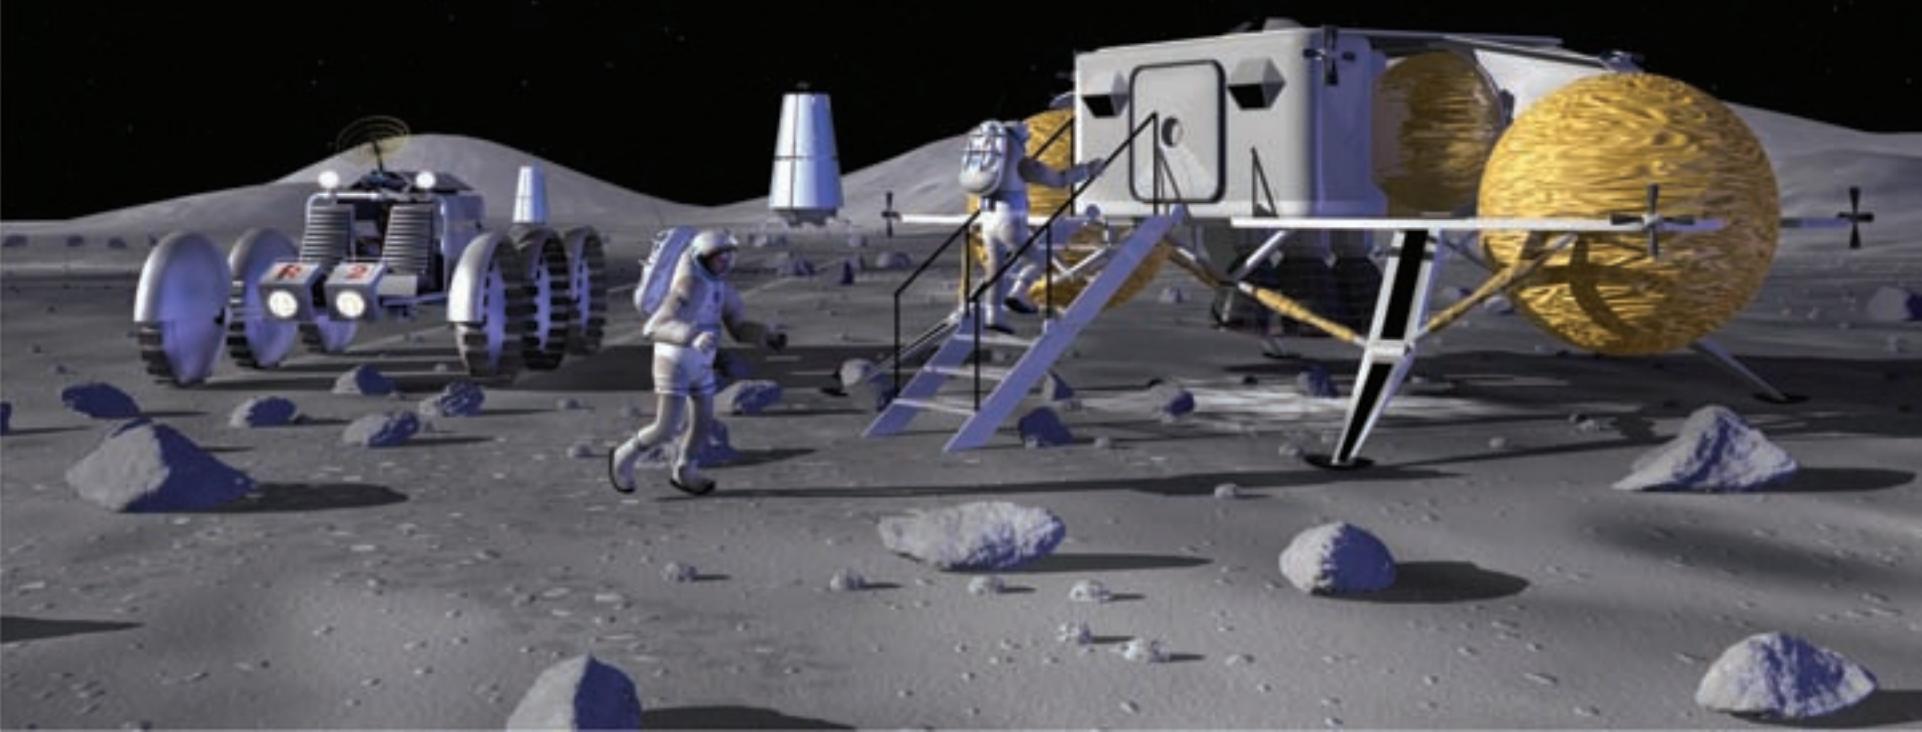

Why is it important for engineers  
and simulant users to understand  
lunar history?

*Because...*

It explains the motivation for the exploration of the Moon

## Earth is Dynamic

- Plate Tectonics
  - Surface is constantly recycled
- Water
  - Weathering of the surface
  - Breakdown of rocks and minerals
- Atmosphere
- Life!
  - Vegetation, animals

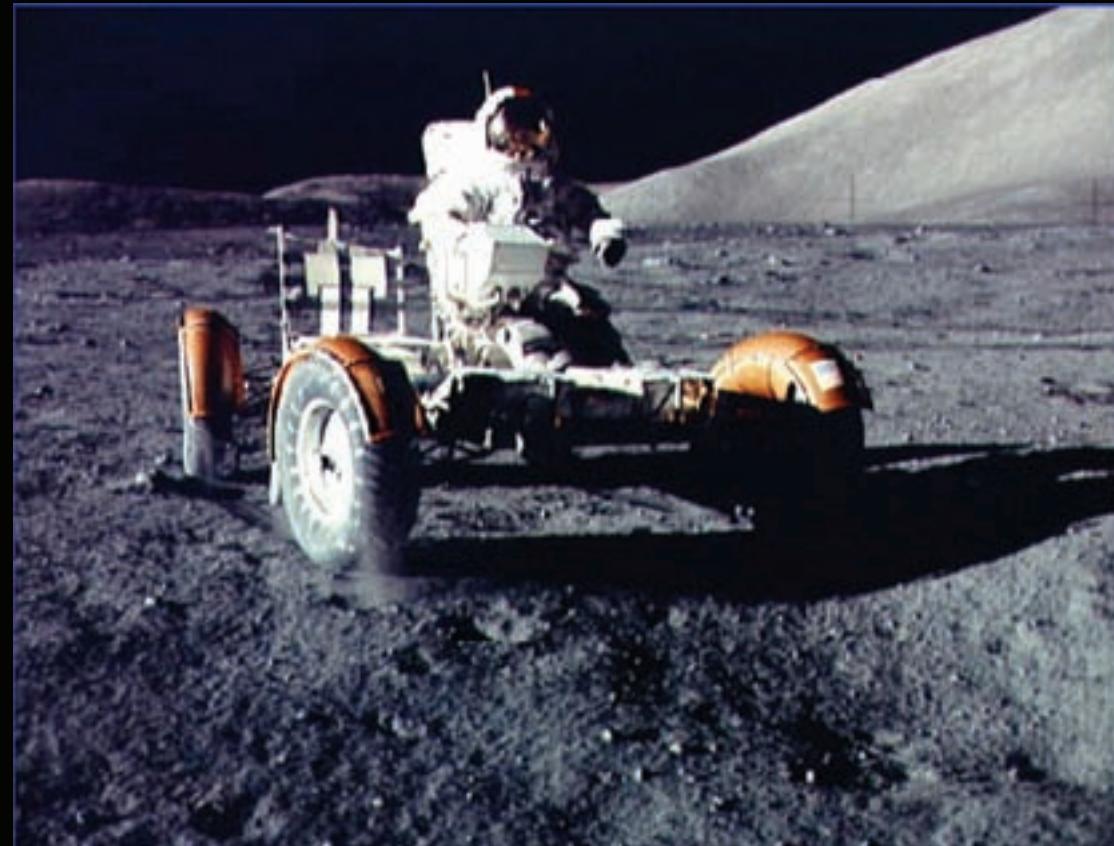

# The Moon is Static

- Rock formation 4.5-2.8 billion years ago
- Major craters formed  $\geq$  3.9 billion years ago
- The Moon serves as a window into the early experiences of our own planet
- By understanding lunar history, we may better understand the history of Earth

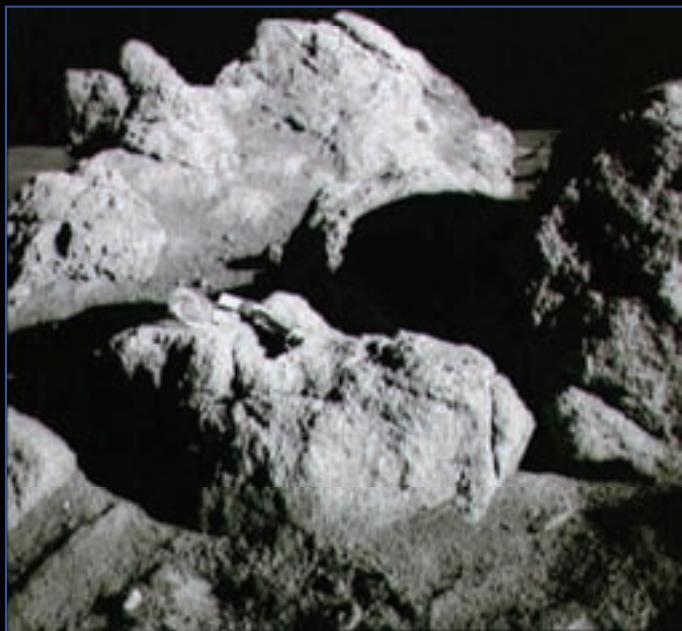

It explains the origin of the operating environment for spacecraft

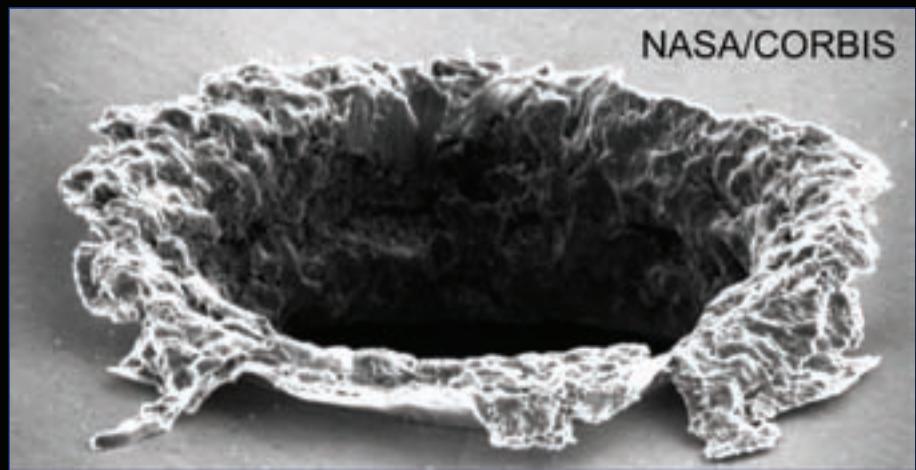

It describes hazards to humans and  
spacecraft

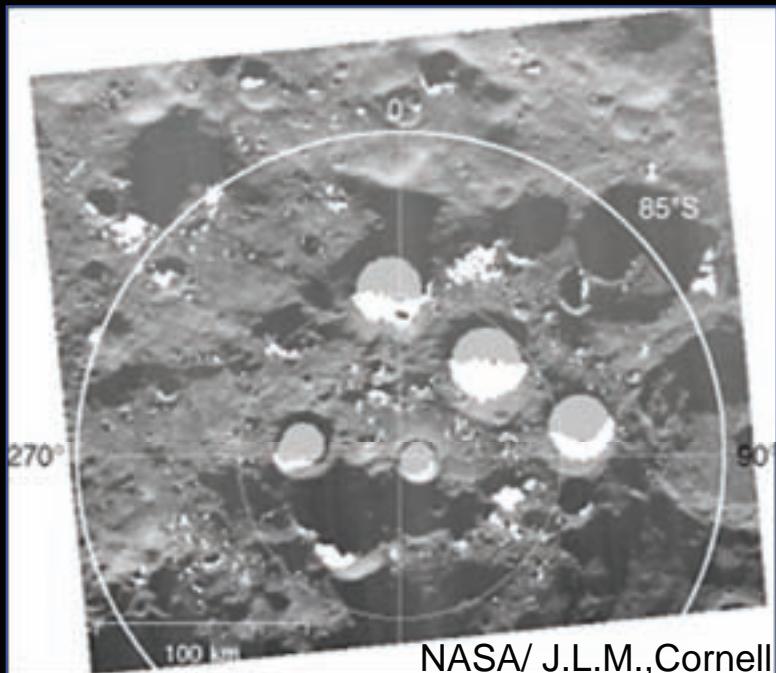

**Regolith**

**Micrometeorites**

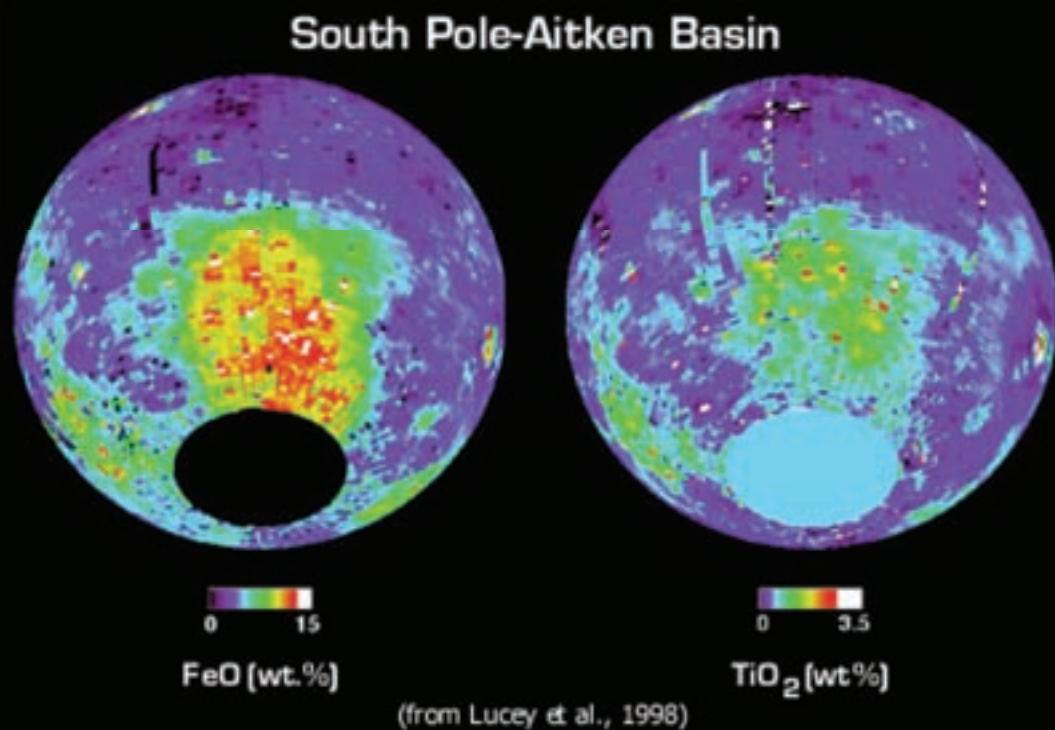

**Morphology**

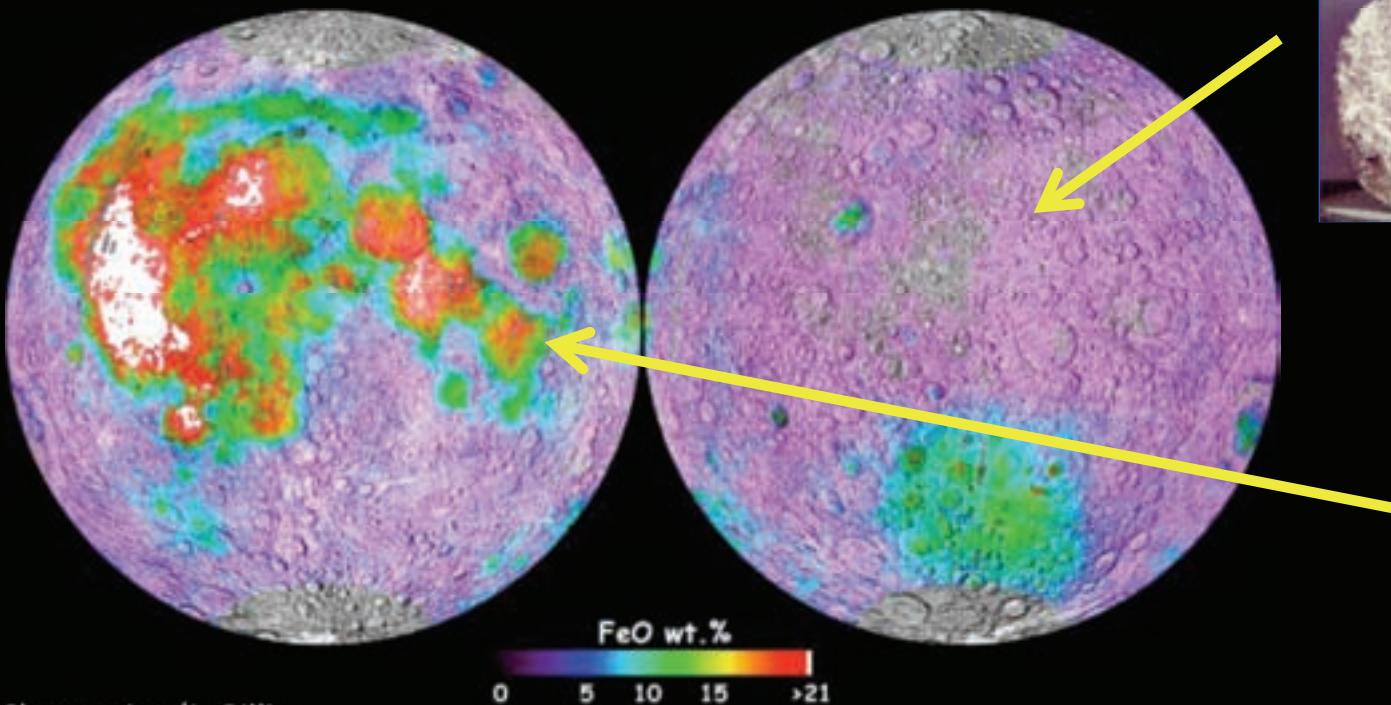

**Permanent Shadow  
Volatiles**

It influences landing  
site locations

It provides the basis for predicting the chemical composition of the lunar surface at specific sites

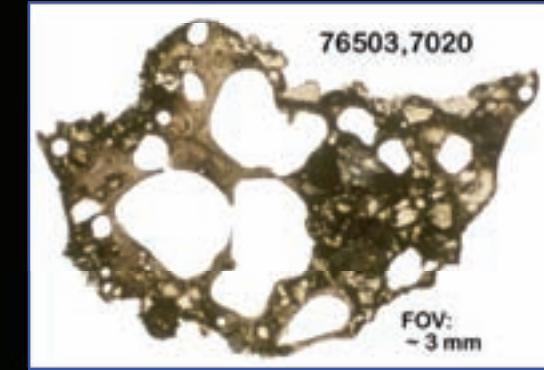

# It explains the origin of the regolith

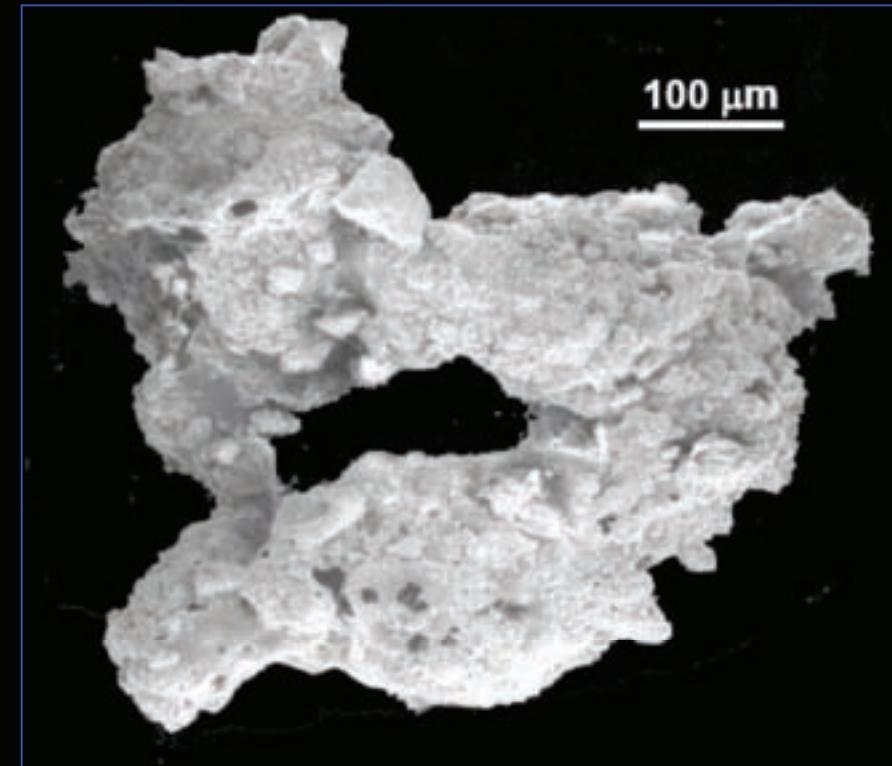

**False color image of  
Meteor Crater, AZ  
(Infrared)** J. Garvin

**Agglutinates**  
B. Jolliff

It explains the size distribution of regolith components

**Boulders and agglutinates**

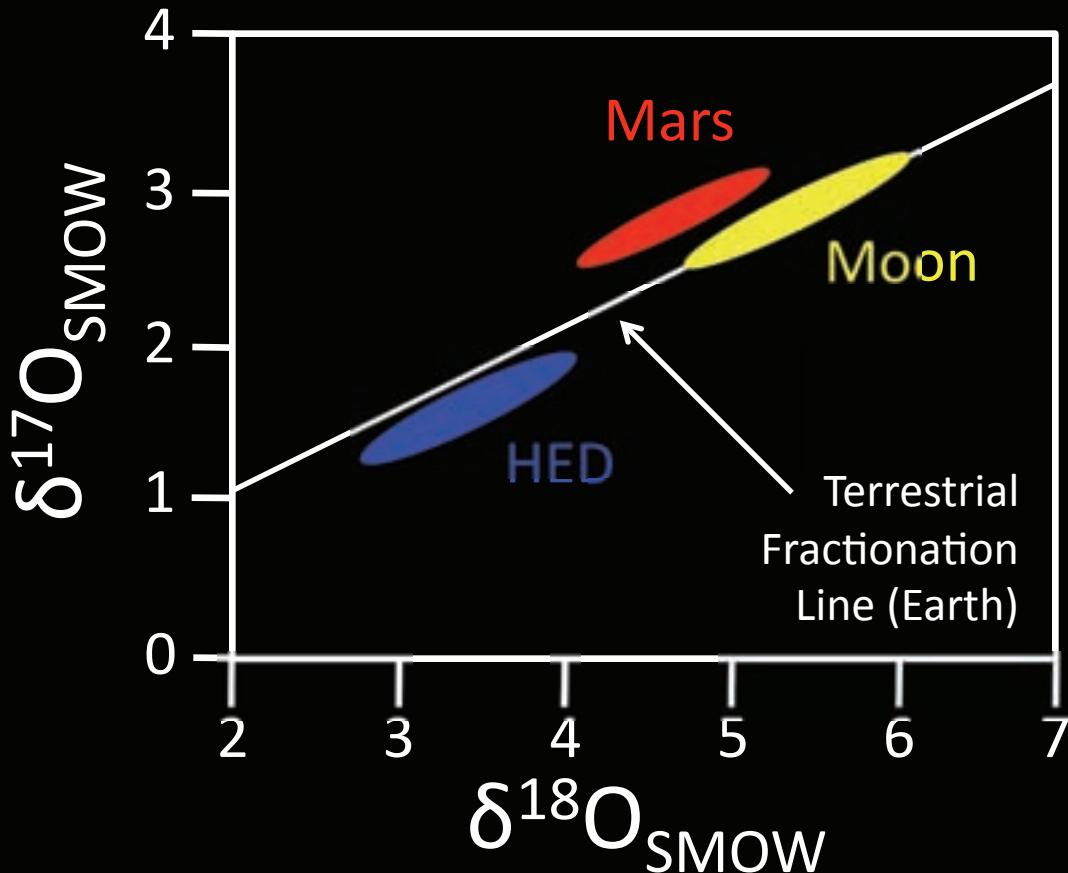

D. S. McKay

# Formation of the Moon

Earth and Moon:

- Similar chemistry
- Oxygen isotope signature
- Unique angular momentum

# The Lunar Cataclysm

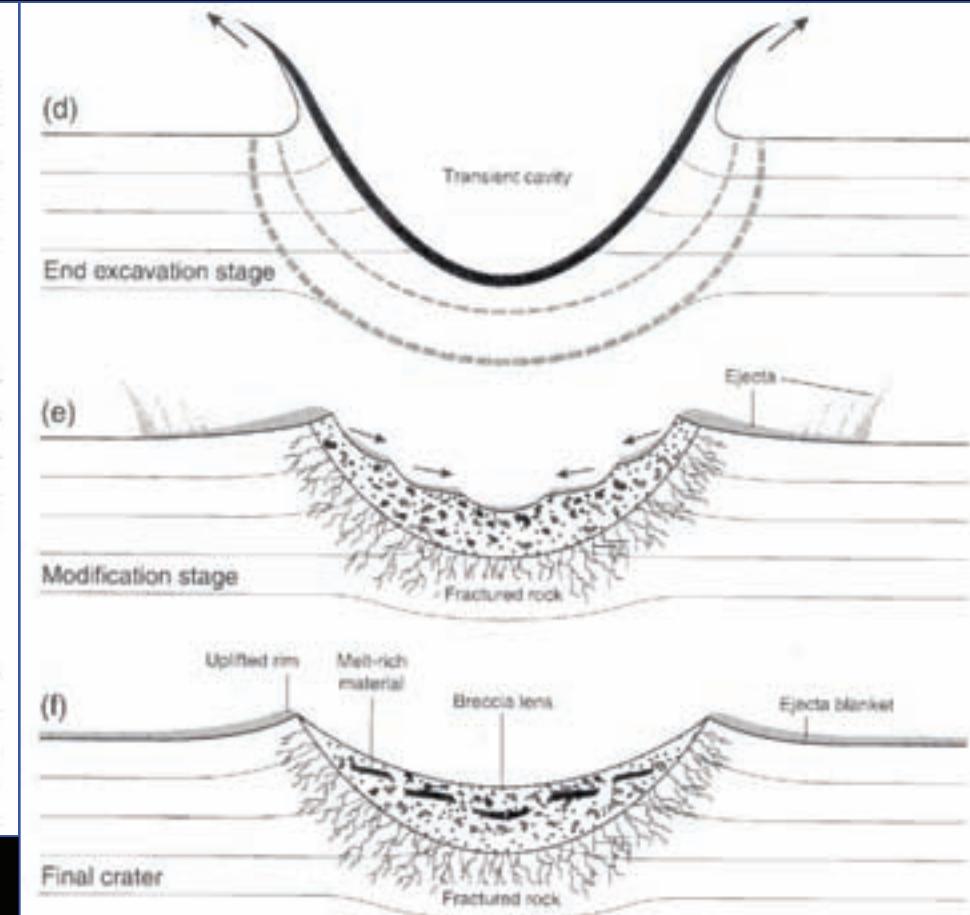

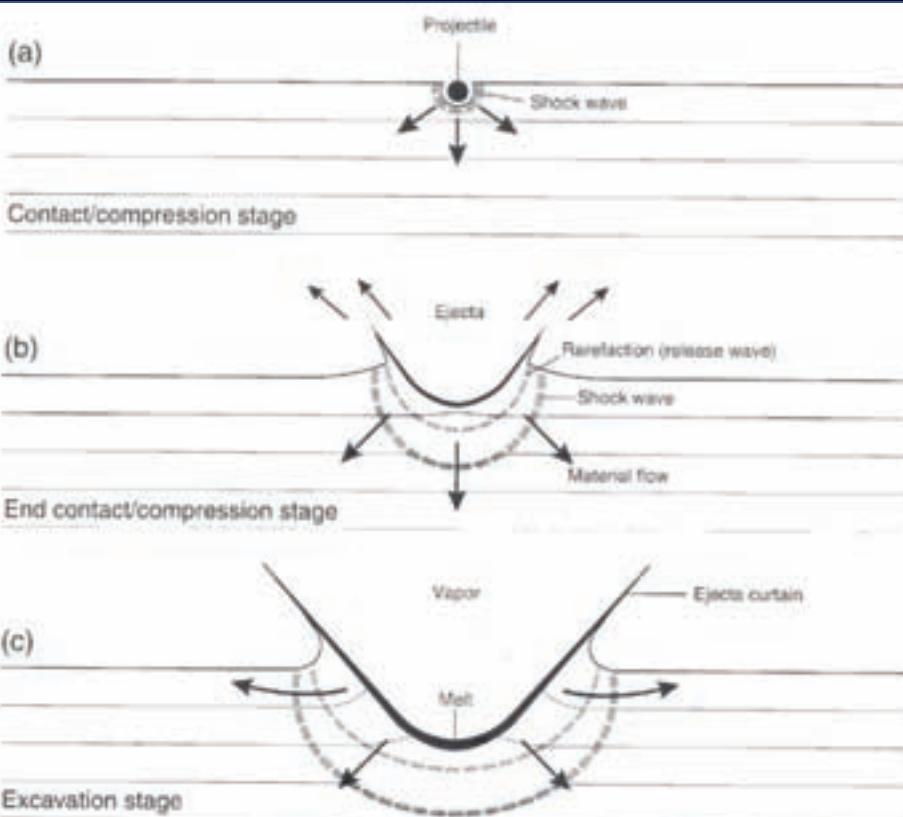

## Size vs. Time

- The largest craters on the Moon were formed during its early history
- The size of impactors has decreased significantly over time

# Solar Wind

# Solar Wind Implantation

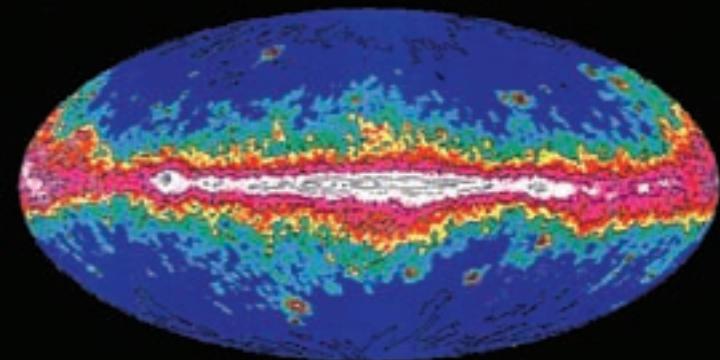

- 1KeV protons, electrons, alpha particles, light volatile elements
- Implantation depth of a few tens of nanometers
- Energetic particles of 1-100MeV can be implanted up to 1cm in depth

# Radiation (Galactic Cosmic Rays)

- 100MeV to 10GeV particles (87% protons, 12% alpha particles, 1% heavier ions)
- Emit gamma rays when interacting with the stellar medium (and lunar surface)
- Particles can change isotopic compositions through neutron capture and spallation
- Implanted meters in depth

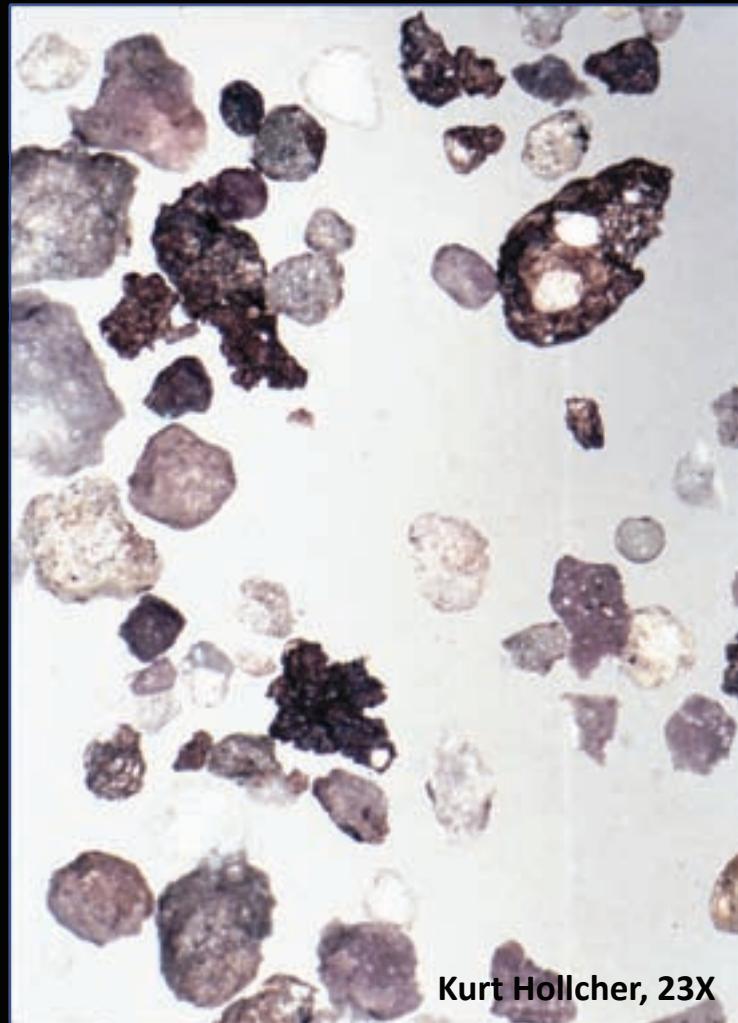

**Milky Way Cosmic Ray Background**

EGRET/Carl Fichtel

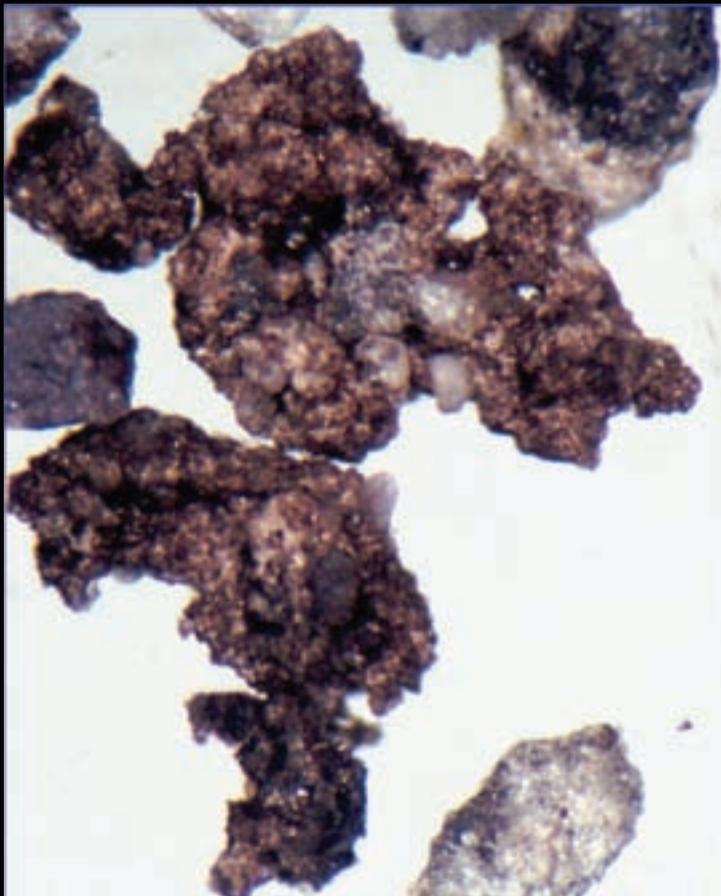

# Generation of Agglutinates

- Regolith particles cemented together by vesicular impact melt glass
- Typically less than 1mm in size
- Formation via micrometeorite impact
- “Mature” soils can contain ~60% agglutinate by volume

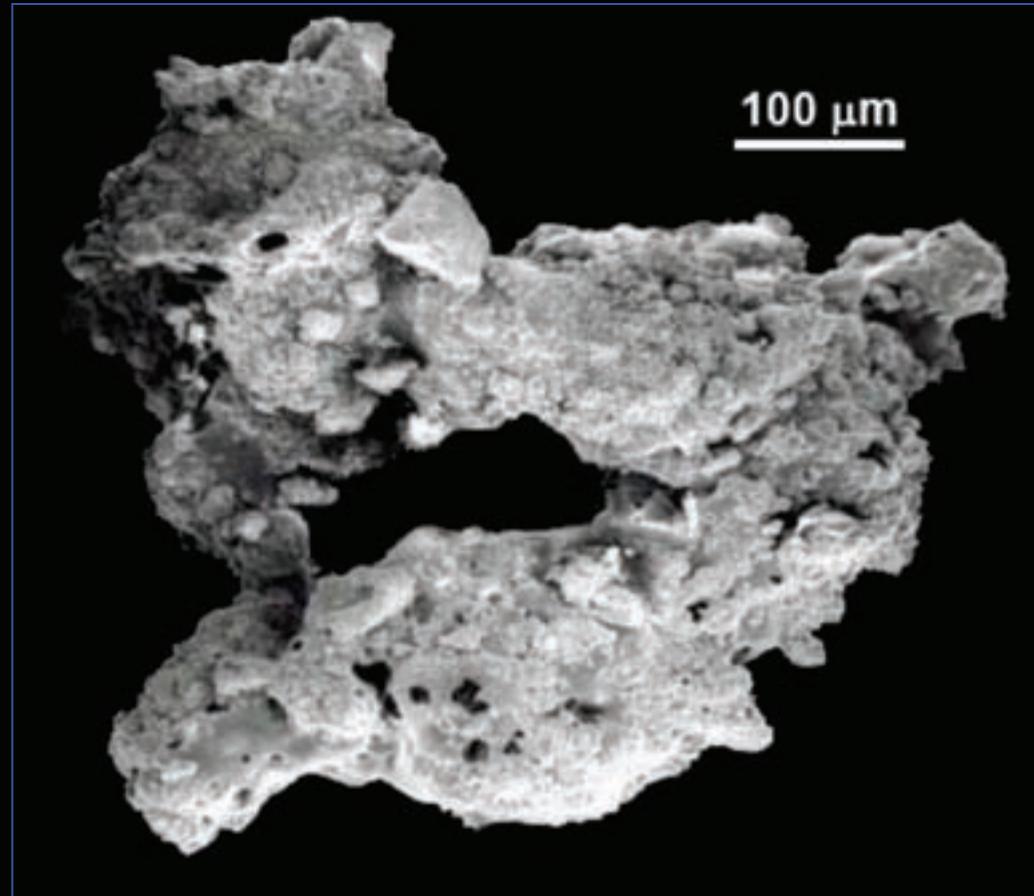

## Agglutinates
